Projects

Self-supervised Topology-aware Non-rigid Point Cloud Registration

Research project Jun. 2022 – Apr. 2023

Proposing a non-rigid registration method, including a topology-aware feature extraction module and a self-supervised training strategy, significantly improves the performance of registration in dynamic topology regions.

Monocular RGB-D based Wound Surface Modeling

Horizontal research project May. 2022 – Jun. 2022

Based on monocular RGB-D video sequences, proposing a highly automatic algorithm to reconstruct high-fidelity wound surface and then measure the area and depth of the wound.

Audio driven Talking Head Synthesis

Horizontal research project Aug. 2020 – Nov. 2020

Developing a deep learning based head reconstruction baseline (via RGB, RGB-D or video input) which utilizes a differentiable rendering technology.

Real-time Face View Correction for Front-facing Cameras

Horizontal research project Sep. 2019 – Oct. 2020

Proposing a fully automatic face view correction system based on a single RGB(-D) camera to solve video problems of “upward nose” and “big face” caused by the disparity between camera location and face orientation.
